- 113 public repositories
- Latest Dot release v1.1.2
- Swift · Rust/WASM

SELECTED PUBLIC WORK

Built in the open.

All projects →

SHIPPED · V1.1.2

Dot

A native macOS companion with a local Qwen3.8 27B model, local Whisper transcription and a local Kokoro voice.

Swift · macOS · Local model

LIVE

Aa 4.8:1 | Aa Fail

WCAG AA

AccessProof

Runs axe-core locally in your browser to check pasted HTML for WCAG A/AA failures, without uploading it.

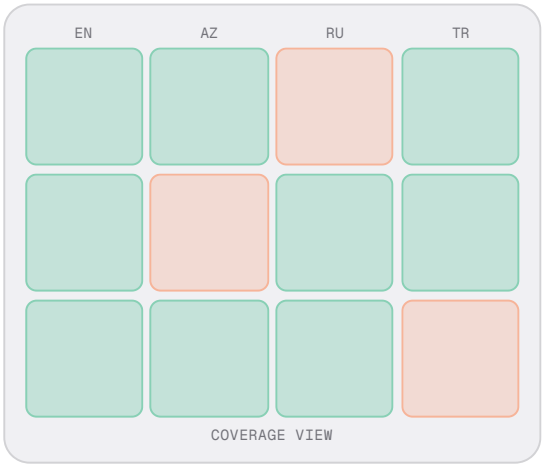

axe-core · Browser · Privacy

LIVE DEMO

Locale

A local-only review desk for multilingual releases. Rust validates coverage and binds decisions to evidence fingerprints; the same core runs as a native CLI or WebAssembly.

Rust · WebAssembly · MIT

AT A GLANCE

Public by default.

113	v1.1.2	22.4 GB	MIT
Public repositories on GitHub	Latest Dot release	Local Qwen3.8 27B model	Dot and Locale licenses

PROJECTS

Public work, shipped.

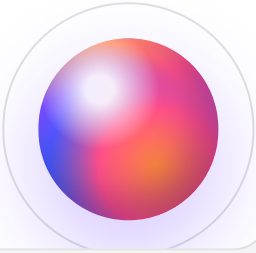

Three apps from my public GitHub: a macOS companion, a browser accessibility scanner, and a multilingual release review desk.

SHIPPED · V1.1.2

Dot

Dot is a native macOS floating companion. Click to talk, click again to interrupt. English transcription runs locally with Whisper, the voice is a local Kokoro helper, and screen context is used only for the conversation you started. The Qwen3.8 27B Q4 model runs on your Mac.

Model	Qwen3.8 27B Q4 · local
Voice	Kokoro · on-device
Privacy	Screen context never uploaded
Platform	macOS 27+ · M5 Pro / 48 GB

The public build is ad-hoc signed and not notarised yet.

LIVE

WCAG AA

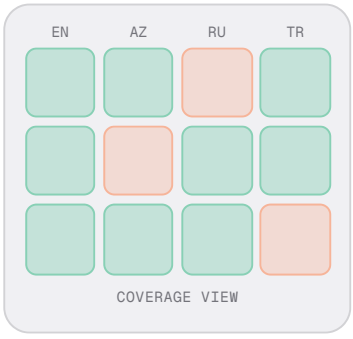

AccessProof

AccessProof runs the vendored axe-core engine locally in your browser. It checks pasted HTML for WCAG A/AA failures, adds best-practice advice, and flags common overlay signatures — without uploading the markup.

Engine	axe-core 4.14.0
Sandbox	No same-origin
Live	GitHub Pages

LIVE DEMO

Locale

Locale is a local-only review desk for multilingual releases. A Rust core validates coverage and binds decisions to evidence fingerprints; the same core runs as a native CLI or WebAssembly in the browser. The demo project is synthetic.

Core	Rust + WASM
State	Tab memory only
License	MIT

ABOUT

Public by default.

I'm Emin. I build useful tools and small games and keep the work open on GitHub. My public repositories cover local-first AI, browser accessibility checks and multilingual release review.

NOW

Dot

The latest public release is **Dot v1.1.2**: a native macOS companion with local Whisper transcription, a local Kokoro voice and the Qwen3.8 27B Q4 model on disk.

Swift macOS MIT

Release notes

GITHUB

113 public repositories

My public profile lists 113 repositories, from macOS apps to browser tools and small games. AccessProof and Locale are the other two apps featured here.

github.com/Emin-dev

HOW IT'S BUILT

Local-first, with limits.

- **AccessProof** scans pasted markup in a sandboxed frame and never uploads it.
- **Locale** keeps review state in tab memory and exports JSON on demand.
- **Dot** uses screen context only for the conversation you started and never uploads it.

TOOLBOX

Small stack.

Languages across my public repositories.

Swift Rust WebAssembly TypeScript Python JavaScript

Dot and Locale are MIT-licensed.
